Semantic Content Description and Object Detection: How Contemporary Deep Learning Models Describe Early Japanese Photographs

Christopher Kermorvant - TEKLIA

Musée national des Arts asiatiques - Guimet

The Dubois Collection at Guimet Museum

- 284 albums, 19,000 photographs, one of the largest collection in the world
- A broad overview of the commercial photographic production in Japan during Bakumatsu and Meiji eras (1853 – 1912)
- A great variety of materials, techniques, styles, subject matters, or price ranges

The HikarlA project

- Develop new tools based on Deep Learning to explore and analyse large collections of historical photographs
- Recognize and accurately name iconographical elements in the photographs
- Identify recurring photographs and similar compositions
- Detect potential patterns in image sequences
- Generate detailed statistical analysis

The HikarlA project

How the AI models trained on contemporary western photographs « see » the Japanese photographs from the XIXth century ?

Captioning

Grounding DINO

CLIP

Image Captioning

Prompt: This image is a 19th century Japanese photograph, describe it.

Answer:

The image is a black and white photograph of a group of people, possibly samurai, gathered around a map. They are dressed in traditional Japanese clothing, with some of them wearing kimonos. The group consists of at least nine individuals, with some standing and others sitting on the ground.

The map is placed in the center of the scene, and the people are positioned around it, engaged in conversation or studying the map. The photograph captures a moment of collaboration and shared interest among the group members.

Image Captioning

Prompt: Give a list of all objects present in this 19th century Japanese photograph, do not make sentences.

Answer:

Map, umbrella, sword, hat, robe, bow, and a group of people.

The format of the description can be adapted for archival/indexing purposes

Models:

Open Source

Open Source

AP

Learning Transferable Visual Models From Natural Language Supervision, Alec Radford et al., 2021 Sigmoid Loss for Language Image Pre-Training, Xiaohua Zhai et al., 2023

Data:

- Manual tagging by a single person of 18,155 images
- 2,209 tags including
 - content: child, river, fan
 - elements of Japanese culture: geisha, shamisen, torii
 - types of photographs: group portrait, landscape
 - Japanese locations or monuments: Nikko, Yokohama, Toshogu Shrine

Data set for the experiments:

- Random selection of 6 albums, 275 images
- Tag set reduced to 1,034 considering only common names in French
- **Goal**: being able to manually validate the predictions of the models

Model configuration for the experiments:

- Same prompt for the 3 models
- The prompt contains the list of possible tags
 - The reduced tag set: the 190 tags of the subset of images
 - The complete tag set: 1,034 tags

Model	Tag set	Precision	Recall	F1
	Reduced	15.7	11.5	13.3
CLIP	Full	12.9	6.6	8.7
Soci ID	Reduced	13.2	10.4	11.6
Seglip	Full	12.6	7.8	9.7
	Reduced	74.8	42.5	54.2
ChalGPT 40	Full	25.6	20.6	22.9

- Open Source models are far behind ChatGPT
- ChatGPT has a low recall with both tag sets
- ChatGPT has a low precision with the full tag set

Manual tags

Path Boat Natural landscape Hozugawa Rapids People River Studio Tamamura Colored GPT4o tags

Boat Natural Landscape

People River

Cherry tree

New reference : *Full validated*, manual validation of the predictions For each prediction, if the tag is correct, the tag is added to the ground-truth

Model	Tag set	Precision	Recall	F1
	Reduced	74.8	42.5	54.2
ChatGPT 40	Full	25.6	20.6	22.9
	Full validated	80.2	43.5	56.4

ChatGPT40 predicts fewer tags but is accurate in its predictions

Limitation of the captioning approach: only allows for (closed) keyword search

Image semantic search

CLIP Model

(2) Create dataset classifier from label text

Search application

- Encode the low resolution images with CLIP
- Store them in a vector database
- Encode the textual query with CLIP
- Search the closest vector in the database
- Display the best results

Conclusion

Models can analyse old photographs using contemporary, common vocabulary in English/French

- Multi-lingual interactions should be evaluated
- The interaction with the thesaurus can be improved (hierarchical approach)
- Automatic evaluation is complex due to subjectivity

Moving from lab evaluation to field evaluation
